Keeping up with the digital revolution [35](#)

A photograph of two healthcare professionals, a man and a woman, wearing green scrubs and blue hairnets. They are both looking down at a tablet device held by the woman. The man is on the left, and the woman is on the right, smiling. They appear to be in a clinical setting with green tiled walls in the background.

01

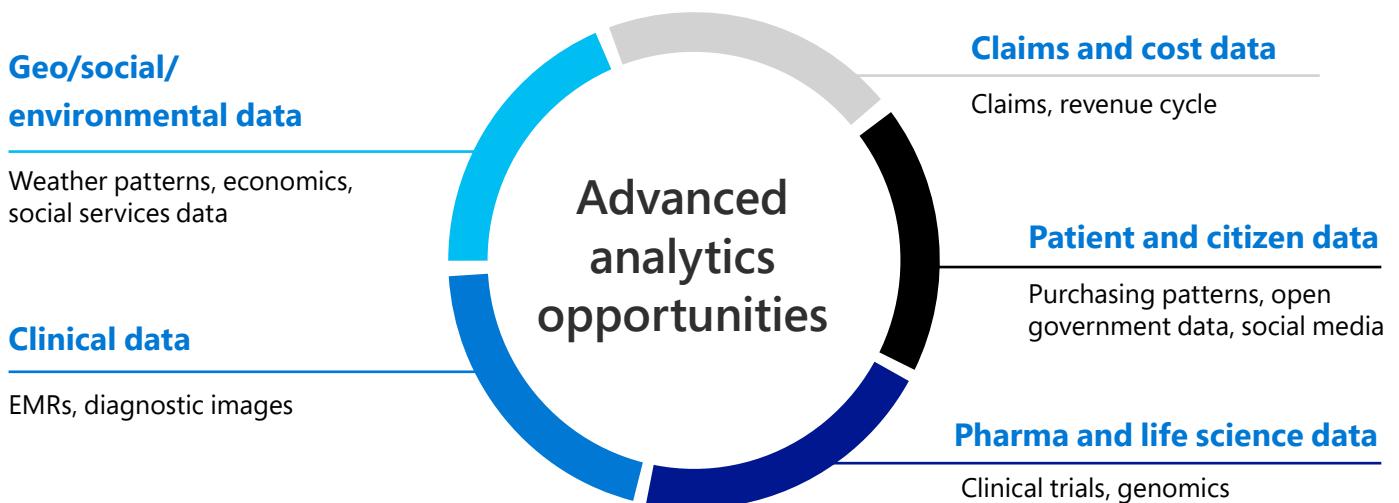

The healthcare opportunity: AI and your data

The healthcare opportunity: AI and your data

Rapid advances in digital technology are redefining the way businesses operate and deliver value. Digital technologies—including artificial intelligence (AI), machine learning, and augmented reality, among others—are transforming every industry. They're accelerating innovation, improving decision making, automating and speeding up processes, and saving overall costs.

The healthcare industry is no exception. It's being profoundly influenced by this ongoing digital revolution. Health leaders today recognize that innovation requires moving beyond the use of electronic medical records (EMRs) and embracing key principles of digital transformation.

The care that patients receive—and the methods in which hospitals deliver care—has been dramatically transformed with the introduction of advanced technologies and the increasing availability of data. Systems of record like EMRs have laid the foundation for intelligent healthcare. Applying advanced analytics to massive amounts of data from internal and external sources like clinical analytics and environmental systems can help health organizations glean deeper insights. These systems of insight are the next evolution of digital transformation. With better access to the right data at the right time, you can reduce operating costs, improve the quality of care, increase the involvement of consumers in the care process, and optimize provider satisfaction.

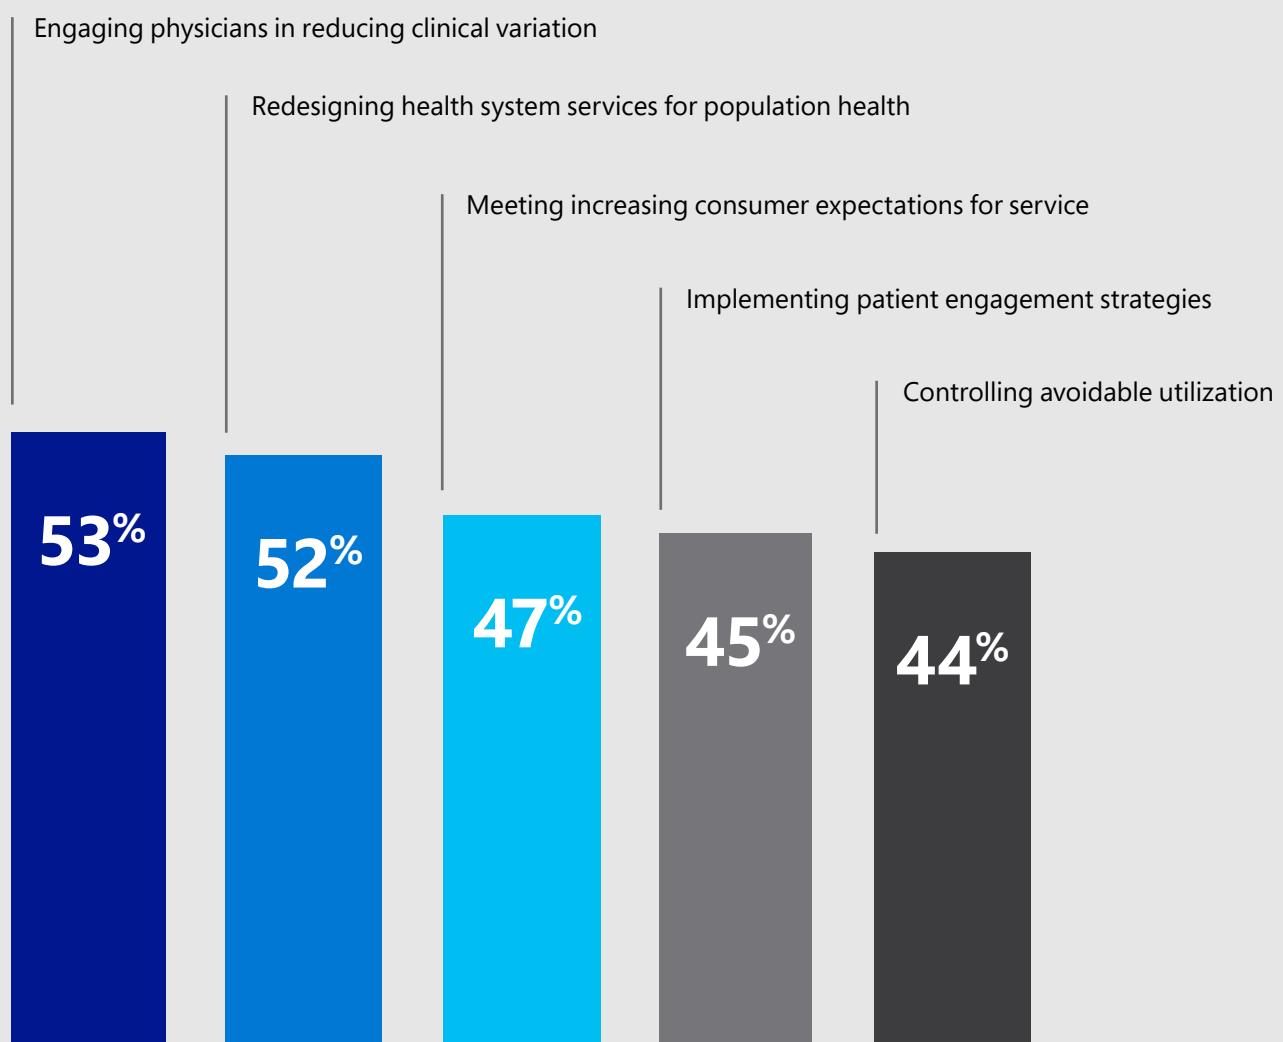

Unstructured data is the information that resides outside of organized databases such as electronic health records and lab reports. If we become capable of tapping the **potential of that data**, we could make patient care more efficient and cost-effective than ever before.”

Source: [PWC Report, 2017](#)

A new paradigm for better patient care

AI has been a long-promised savior for the healthcare industry, but many providers are growing skeptical. The reality is that while the promise of the future is very real, there are practical applications in place now that are already meeting the needs of healthcare executives.

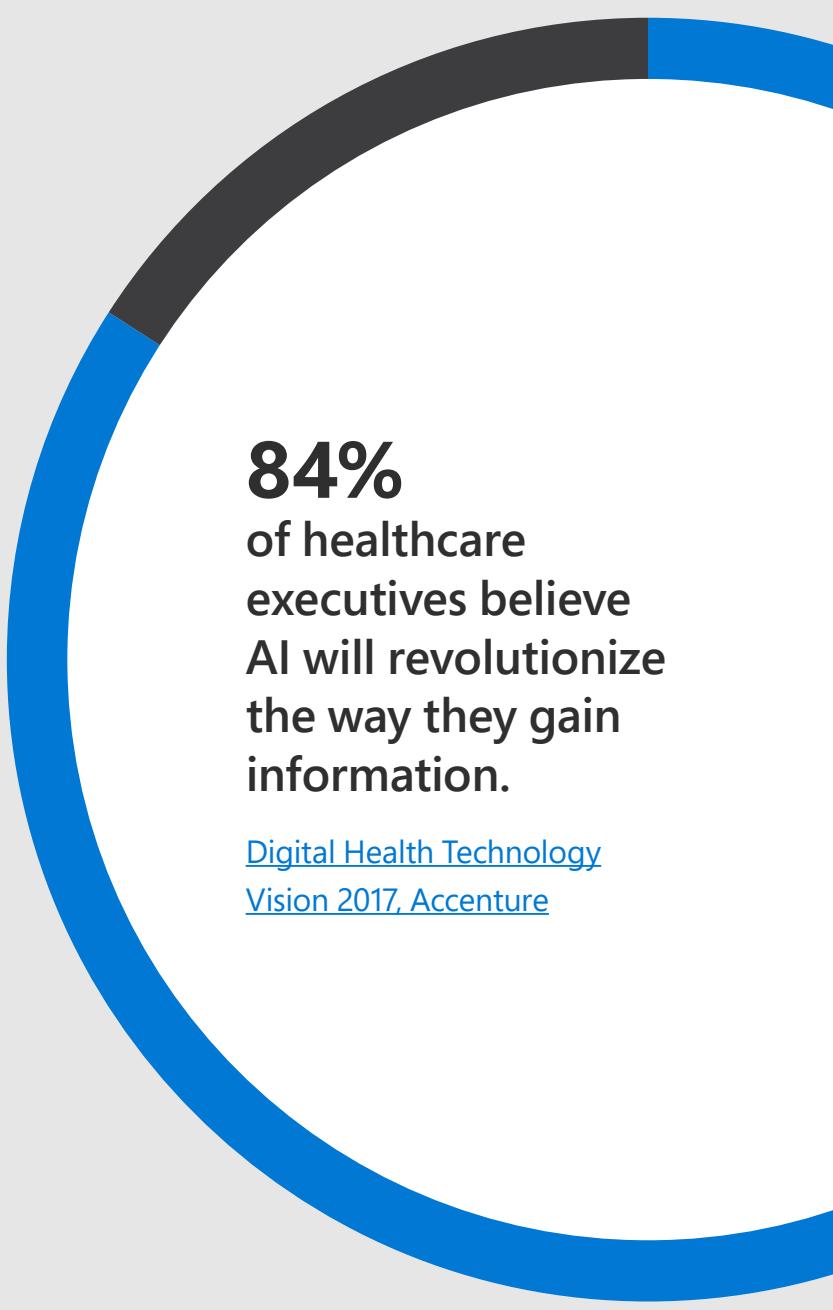

According to the Advisory Board Company's Annual Health Care CEO Survey, top areas of concern for hospital and health system executives in 2016 were:

The new paradigm for healthcare is the use of real-time data and AI to enable a predictive and prescriptive analytical approach. In practical terms, this means that AI is providing the capability to sense the healthcare world, comprehend, act, and learn. AI uses machine learning and delivers capabilities to mimic human types of behavior and performance—to ultimately improve patient care and outcomes. AI systems gather and crunch massive amounts of data in real time to identify patterns. They then use that information to automate and streamline healthcare processes. Here are a few examples of what these systems can do:

Healthcare leaders can take advantage of AI tools to empower care teams, engage patients, optimize clinical and operational effectiveness, and ultimately transform healthcare.

-  Predict the future condition of individual patients based on early warning signs.
-  Determine best practices in operations management by comparing data from multiple facilities.
-  Recommend medications based on the successful treatment of similar patients.
-  Detect and prevent fraudulent claims or other abuses.

84%
of healthcare
executives believe
AI will revolutionize
the way they gain
information.

[Digital Health Technology Vision 2017, Accenture](#)

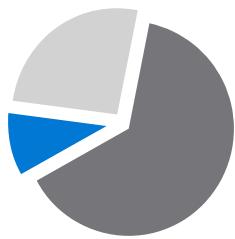

A photograph of a woman with dark hair tied back, wearing a light-colored lab coat over a white shirt. She is resting her chin on her hand and looking directly at the camera with a thoughtful expression. The background is blurred, showing what appears to be a laboratory or medical facility with various equipment and monitors.

02

How does AI lead to better care?

How does AI lead to better care?

It's important to enable AI for everyone in the care process and understand the significant opportunities that exist. Transformation based on data and AI is delivering clinical and operational analytics solutions that can improve the quality of care for patients throughout their care experiences. Let's see how:

Clinical analytics focuses on the use of data and analytics to improve clinical treatment processes and outcomes.

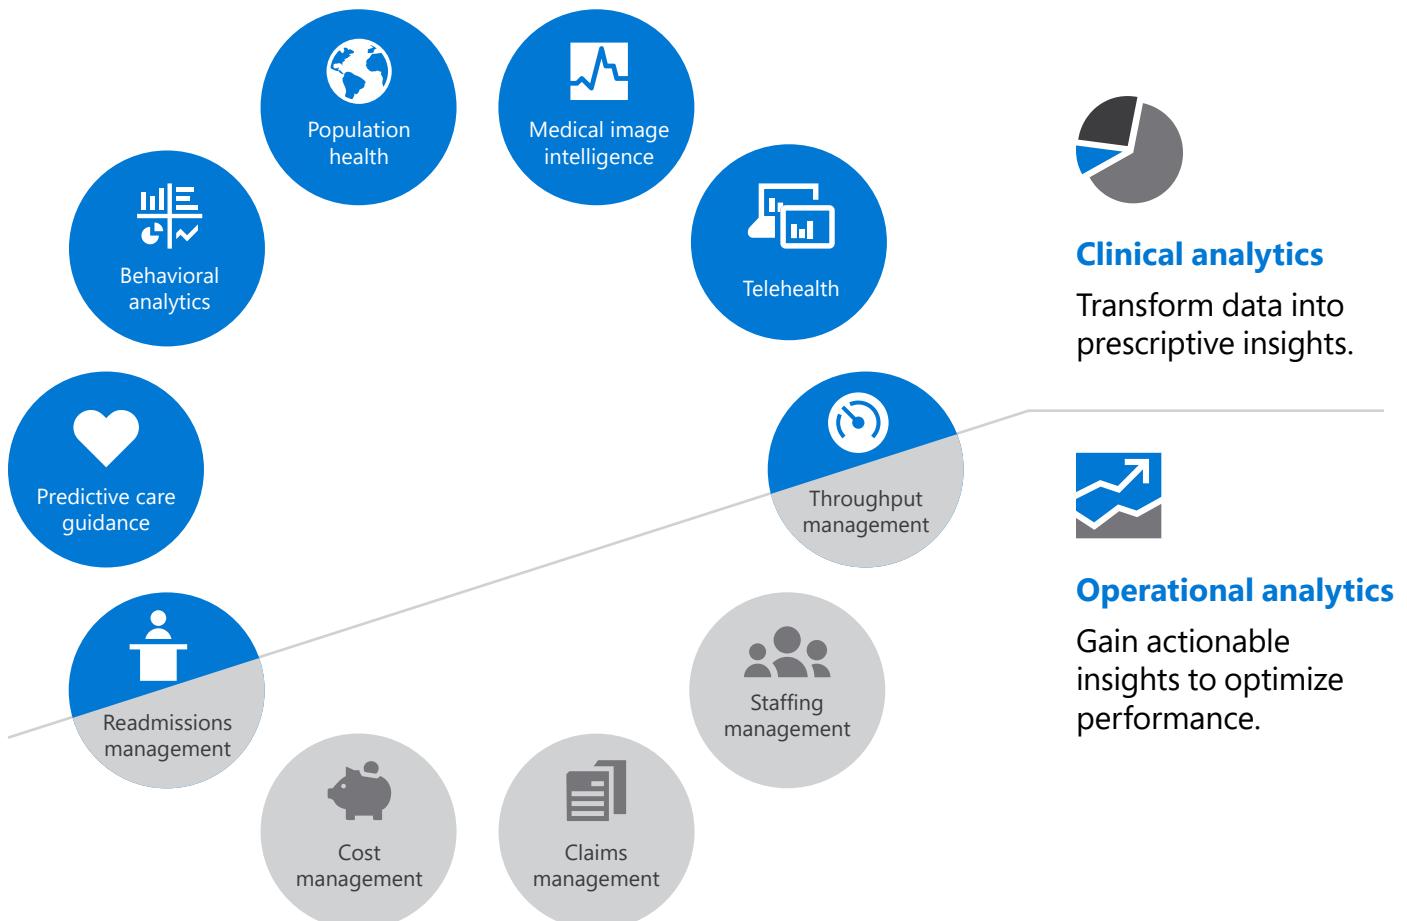

For example: clinicians can pull insights from data to help identify at-risk patients and deliver optimal treatments. Sophisticated analytics engines enhanced through machine learning and AI can provide evidence to inform actions.

Operational analytics focuses on the use of data and analytics to improve the efficiency or effectiveness of systems used to provide and manage care processes.

For example: by using AI, healthcare teams can predict operational issues, track safety metrics, monitor equipment health, maintain the integrity of the supply chain, and identify fraud.

Following are some scenarios in which AI is already delivering value. They exemplify opportunities to improve both clinical quality and operational effectiveness in healthcare organizations.

03

Clinical analytics in healthcare

Predictive care guidance

Start with these questions

Do you use analytical systems that help clinicians predict the effectiveness of treatments?

If so, in what areas are you applying predictive care guidance?

If not, are there areas within the provision of care in which you would find such systems especially useful?

Key benefits

For providers

Clinical pathway prediction

Drug effectiveness

Disease progression prediction

For payors

Health risk prediction

Predictive risk scoring

What is predictive care guidance?

Predictive care guidance uses analytical solutions to search through large amounts of data from sources like EMRs, smart medical devices, patient and population demographics, and the public domain to find hidden patterns and trends and predict outcomes for individual patients. Most predictive care guidance relies on AI learning models that become more precise when additional data and cases are introduced.

Predictive analytics is a data-driven crystal ball taking analytics to the next level, beyond descriptive or diagnostic methods that look backwards on what happened and why.

How can it help your organization?

Predictive care guidance enables clinicians to determine the likelihood of disease and helps with determining diagnoses and predicting future wellness or illness. Predictive guidance can improve the quality of healthcare and reduce the costs of care. It provides clinicians with answers they're seeking for individual patients, with a focus on increasing the accuracy of diagnoses.

Outcomes of using analytical models that connect symptoms to treatments

For providers:

Clinical pathway prediction. Assess and predict which treatment option will likely produce the best outcome for a patient.

Drug effectiveness. Predict which drug will produce the best outcome for a patient.

Disease progression prediction. Predict the likely path and progression of a disease.

For payors:

Health risk prediction. Predict the likelihood that a patient presenting a certain set of symptoms is at risk for an adverse health event.

Predictive risk scoring. Assess which patients might be at risk for readmissions and hospital-acquired infections.

Predictive care guidance in action

A new AI tool launched by Ochsner Health System **analyzes thousands of data points to predict which patients will deteriorate in the near future.** Built with a machine learning platform, the tool triggers alerts to prompt Ochsner's care teams to intervene and proactively treat patients and prevent emergency situations.

During a 90-day pilot with the tool, Ochsner was able to **reduce the hospital's typical number of codes (cardiac or respiratory arrests) by 44%.** In addition to sending pre-code alerts, this predictive model is capable of predicting any patient deterioration that needs attention based on lab values, vital signs, and other data.

Watch the video to learn more about [how Ochsner prevents cardiac arrests by using AI](#).

Behavioral analytics

Start with these questions

How well do your care providers and care recipients conform to recommended care protocols?

Does your organization use value-based payment systems, in which quality or outcome measures affect your reimbursements?

» Key benefits

For providers

Patient engagement

Readmissions

For payors

Individual health and well-being

What is behavioral analytics?

Behavioral analytics is a term used in marketing to describe the analysis of consumer behavior patterns that informs how to market or deliver an action in a way that increases the odds of adoption.

While clinical analytics can recommend a clinical action, applying behavioral analytics increases the likelihood of the action being taken. This is sometimes called *nudging* the patient or care provider.

Other industries use behavioral analytics to suggest add-on sales or display content based on previous usage patterns. This is how Netflix recommends movies that a customer might like. The method of deriving suggestions is particularly important in healthcare because suggestions will be put off or ignored if they're not easy to implement.

How can it help your organization?

Incomplete application of evidence-based medicine is a leading cause of poor outcomes and increased overall cost of care. Behavioral analytics can increase the adoption of recommended practices.

Benefits of behavioral analytics

For providers:

Patient engagement. Engage patients and care providers to ensure conformance and increase the likelihood of the best possible care.

Readmissions. Reduce readmissions and even prevent initial admissions through proactive targeting.

For payors:

Individual health and well-being. Improve health awareness and preventive care choices in patients.

Behavioral analytics in action

Behavioral analytics can drive nudge platforms like the one from Azure partner [NextHealth](#), which **delivers recommendations to health plans to increase member conformance**. It enables increased patient engagement and risk identification—to ultimately **improve health and cost outcomes**—by using an analytics platform and personalized data to provide optimized recommendations.

Population health

Start with these questions

Which of your patient populations consume the most resources?

Is your organization using value-based payment systems, in which quality or outcome measures affect your reimbursements?

Key benefits

For providers

Integrated care

Specialty care

Patient engagement

For payors

Cost management

Self-care management

What is population health?

The term *population health*, which is widely used in the healthcare world, covers a variety of topics.

Population health strives to influence the delivery of care to a group of individuals that have similar healthcare needs, as opposed to focusing on evaluating and treating medical conditions one patient at a time.

How can it help your organization?

Payment systems are moving from a fee-for-service business model to one that incorporates value into the payment equation. Meeting payor requirements during this transition requires greater use of data and analytics, including better data on patient-reported outcomes, social determinants of health, patient and member risk stratification, and activity-based costing.

Benefits of implementing population health

For providers:

Integrated care. Implement integrated care—coordinated treatment across care team members, including clinicians, social workers, physical therapists, and behavioral health care professionals. Analytics can help identify and measure the effectiveness of care across all care settings.

Specialty care. Use data to determine the best ways to manage health needs and outcomes for entire populations of people suffering from chronic conditions.

Patient engagement. Empower patients to more effectively manage their own health and participate in the decision-making process to improve outcomes.

For payors:

Self-care management. Use patient data to improve patients' understanding of their role in their wellness, help them stay healthier, and reduce the cost per service.

Cost management. Manage the health of populations by creating better outcomes at an efficient cost.

75%

Patients with chronic conditions consume more than 75 percent of healthcare spending.

Population health in action

Scientists and physicians at Johns Hopkins Medicine are gathering huge amounts of data from medical care, genomics, and wearable devices to **predict disease progression and pinpoint individual treatments**. They're examining individual diseases by looking deeply into their subgroups.

Because patients in the same disease subgroups are likely to have the same biological conditions and show the same response to treatments, researchers can use this information to discover mechanisms that drive specific diseases.

To **improve diagnoses, prevention tactics, and cures**, the team is conducting data investigations of patients treated for prostate cancer, multiple sclerosis, cardiac arrhythmias, amyotrophic lateral sclerosis, and more.

Watch the video to learn more about [how Johns Hopkins Medicine plans to change the face of disease](#).

Medical image intelligence

Start with these questions

Are you (or your imaging partners) doing anything to embed analytics or intelligence into the medical imaging process?

What type of analytics are you using to evaluate the effectiveness of your imaging systems?

Key benefits

For providers

Diagnosis and treatment optimization

For payors

Speed and quality

What is medical image intelligence?

Medical image intelligence is the embedding of analytical capabilities into images to augment or improve diagnostic and treatment planning processes.

How can it help your organization?

Medical images represent one of the largest categories of unstructured data used in healthcare.

Specialists like radiologists, oncologists, ophthalmologists, and others are trained to evaluate medical images to assess medical conditions, make diagnoses, and deliver treatments based on their reading of these images. Analytics technologies can increase the effectiveness of these efforts.

Benefits of implementing medical image intelligence

For providers:

Diagnosis and treatment optimization.

Assist specialists in making diagnoses, improve treatment planning, and increase the efficiency of these processes.

For payors:

Speed and quality. Improve the quality of image analysis while driving down costs for payors.

Medical image intelligence in action

The Microsoft [InnerEye](#) research project uses state-of-the-art AI to build innovative image analysis technologies that help doctors treat diseases like cancer in a more targeted and effective way.

InnerEye employs decision forests and deep neural networks to enable medical software providers to deliver tools that radiation oncologists can use in planning radiotherapy treatment. The cloud-based radiomics service is intended to enable the development of third-party products that better assist radiation oncologists and dosimetrists, allowing medical experts to focus on more detailed tasks like editing and refining results.

Learn more by watching the [InnerEye video overview](#).

Telehealth

Start with these questions

Do you have virtual tools and services that enable clinicians and care teams to access real-time information about a patient's issues, prescriptions, biometrics, vitals, and other clinical information?

Do you have modern digital tools to remotely connect with your patients and engage them in their healthcare journeys?

Key benefits

For providers

Improved patient outcomes and clinician productivity

Transformed virtual care

Increased patient access to care

For payors

Improved Quality Scores

Increased beneficiary satisfaction

What is telehealth?

Telehealth refers to the use of digital healthcare tools and telecommunications technologies to engage health consumers and encourage self and peer care, promote remote care coordination and management, and reduce costs.

Examples of telehealth technologies include video conferencing, machine learning, the Internet of Things (IoT), AI, chatbots, and wearable technology that resolve logistical challenges of hospital wait times and provide proactive care coordination.

How can it help your organization?

An intelligent telehealth program helps clinicians make informed diagnoses and recommend treatments that align to patient care coordination plans. By using machine learning and AI, healthcare providers can implement effective remote monitoring programs and devices and make better use of the clinical workforce when monitoring patients remotely. Machine learning algorithms for chatbots can

recommend diagnoses based on symptoms and patient health data to help clinicians make better treatment decisions. AI technology can empower providers in effective telestroke programs to identify strokes more quickly and begin life-saving treatment remotely.

Benefits of implementing telehealth

For providers:

Improved patient outcomes and clinician productivity. Use AI and telehealth to reduce the need for physician data entry. Allow patients and clinicians to spend more time interacting with each other to enhance the experience and overall patient/provider relationship.

Transformed virtual care. Transform virtual care by incorporating telehealth technologies and innovative uses of data. Keep patients connected and create better understanding among remote care teams.

Increased patient access to care. Increase your range of coverage and your ability to remotely diagnose medical issues, which helps reduce overcrowding in hospitals.

For payors:

Improved Quality Scores. Improve health outcomes and reduce hospitalizations and readmissions with remote patient monitoring tools supplemented by video or phone-based consultations with providers. This also directly improves payor Quality Scores and cuts costs.

Increased member satisfaction. Use telehealth and digital engagement to allow members to better manage their treatment plans. This improves care coordination and member satisfaction and promotes healthy behavior.

Increased member access to care. Offer telehealth benefits to provide your members with quicker access to care when needed, avoiding escalation of sickness and reducing costs.

Telehealth in action

[Bupa's telehealth initiative](#) is transforming the way clinicians and patients are connecting. This increases health literacy and helps patients achieve their wellness goals. Bupa deploys Microsoft Dynamics 365 as a scalable, secure solution to provide 360-degree views of client information and enable tailored health recommendations.

The telehealth platform helps provide these values to patients and clinicians:

Prevention and early intervention

Connected health and next steps for care

Ability to navigate the care system

Insights on how to better enhance health and wellbeing

The program also supports patients who are identified by hospital clinicians as having a high chance of being readmitted. Patients with multiple risk factors are referred to a home support program. In this program, they automatically receive four calls during the month following their discharge. Clinicians can check on medicine status and patient condition during these calls.

Another initiative is intended for patients aged 75 and over. Bupa proactively contacts identified patients, conducts a modified risk assessment, and then ensures that they're linked to publicly available services and assessments to help them maintain their independence and remain in their own homes longer.

Bupa is also collecting essential insights into what's important to their customers and how to best enhance people's health and wellbeing.

04

Operational analytics in healthcare

Staffing management

Start with these questions

What percentage of the total cost of running your organization involves staffing?

How do you determine staffing levels for your nursing units or clinics?

How often do you face overstaffing or understaffing issues?

Key benefits

For providers

Improved staff retention

Staff training

Staffing level assessment

What is staffing management?

Staffing management is the process of modeling and predicting optimal staffing levels based on factors like predicted patient volume and the type and complexity of patients being treated.

How can it help your organization?

Staffing is the single largest expense of any medical organization delivering services to patients and consumers. In most hospitals, staffing represents more than half of all total expenses.

Data and AI systems allow healthcare organizations to predict staffing levels with optimal accuracy and efficiency.

Benefits of implementing staffing management

For providers:

Improved staff retention. Improve retention of hard-to-find specialty clinicians to maintain sustainable teams. Use predictive analytics to understand when an employee is at risk of resigning.

Staff training. Measure the success of training programs to improve them. Good training is critical in health care because clinician performance has a direct impact on the well-being of patients.

Staffing level assessment. Predict staffing levels and skill sets to optimize them based on the number of patients and the level of acuity of care to be provided.

Staffing management in action

[Healthcare Employee Retention](#) is a solution that uses client data to estimate employee flight risk. It includes a predictive model and reporting that identifies which employees might resign based on historical information from previous team members. The solution includes technologies for data exploration, machine learning, and results delivery.

Claims management

Start with these questions

What percentage of filed claims are being denied or require rework before being paid? Are you seeing changes in this trend?

What are the top reasons for claims being denied?

» Key benefits

For providers

Claims management

Denials and revenue management

For payors

Claims and fraud management

Denial management

What is claims management?

Claims management is the organization, billing, filing, updating, and processing of medical claims related to patient diagnoses, treatments, and medications.

How can it help your organization?

Claims fraud, waste, and abuse are significant issues worldwide. They encompass a wide spectrum of activities, including deceptive billing for services not rendered, performing unnecessary medical services, and abusing payment rules by coding services at higher levels than actually performed.

Denied claims represent extraordinary administrative costs to health providers and payors.

Claims analytics helps you efficiently predict patterns and detect anomalies to fight fraud and waste.

Benefits of implementing analytics for claims management

For providers:

Claims management. Improve the identification, management, and collection of patient service revenue.

Denials and revenue management. Reduce the number of denied claims, a primary contributor to bad debt that represents millions in lost net patient revenue every year.

For payors:

Claims and fraud management. Assess the appropriateness of a claim and predict anomalies within the entire claims data universe to prevent fraudulent activities. For payors, claims management is a critical aspect of determining whether to pay or deny claims, and of determining the rate of payment for services a health provider bills to the payor.

Denial management. Use analytics to track the number of claims filed by providers that a payor denies. For payors, denied claims create large overhead costs.

Claims management in action

[CGI ProperPay](#) is a medical claim analytics solution that helps healthcare payors audit, detect, and prevent inaccurate payments of inpatient, outpatient, and professional claims. It uses advanced algorithms to detect hidden patterns and anomalies within a payor's complete claims universe to point out which claims should be put on hold or rejected, and which paid claims have a high possibility for recovery.

The solution uses perceptual intelligence, machine learning, and the cloud.

Learn more about CGI ProperPay by watching this [video](#).

Cost management

Start with these questions

How do your operating costs compare to reimbursements?

What are your top cost drivers?

Do you have systems in place that help you predict costs so you can better manage them?

» Key benefits

For providers

Staffing optimization

Supply cost management

Throughput management

For payors

Fraud detection

Shorter patient stays

Claims denial management

What is cost management?

Cost management is a broad category relevant to all aspects of care delivery. It encompasses evaluation of all major provider and payor systems that determine the eventual cost of providing and paying for health and medical services.

How can it help your organization?

Most provider and payor organizations today exist on razor thin operating margins. In most countries, the cost of providing and paying for care is rising faster than reimbursements are increasing.

Health providers and payors are using solutions that improve the management of costs while maintaining the quality of services provided.

Cost management solutions use analytics to evaluate and improve the efficiency of major systems used in providing health and medical services.

Benefits of implementing analytics for cost management

For providers:

Staffing optimization. Match staffing requirements—typically the largest single cost—to the current and future mix of patients.

Supply cost management. Evaluate which supplies are most cost effective.

Throughput management. Optimize the flow of patients through facilities—typically the second highest cost—including hospitals, emergency departments, operating theaters, and imaging departments.

For payors:

Fraud detection. Spot potentially fraudulent claims, including those miscoded to generate higher payments.

Shorter patient stays. Predict lengths of stay for covered services to estimate and minimize costs.

Claims denial management. Predict which claims will be denied, reducing the number of denials and the cost of managing them.

Cost management in action

[BlueMetal](#), a Worldwide Microsoft AI Partner, enables Steward Health Care to use Azure Machine Learning to predict how long a patient will be in the hospital and create potential treatment plans to help accelerate care and treatment. It also helps Steward save 48 million USD. During patient intake, when patients specify why they've come to the hospital, AI and machine learning are used to correlate information from various data sources and predict how long the patient's hospital stay will be. This prediction is built on a four-year regression analysis performed on every patient admitted to the hospital. By using this solution, Steward has cut up to a day and a half off of every admitted patient stay, on average. This delivers impressive cost savings.

Learn more by watching this video on how [BlueMetal](#) and Steward Health Care enable transformation with Microsoft AI.

05

Holistic analytics in healthcare

Readmissions management

Start with these questions

What level of inpatient readmissions rates is your organization currently experiencing?

Has your current performance with respect to readmissions affected your level of reimbursement?

Do you have a way to proactively assess which patients have the highest risk of readmission?

Key benefits

For providers

Readmittance risk analysis

For payors

Reduced hospital readmissions rate

Reduced emergency department bounce-back rate

What is readmissions management?

A *hospital readmission* occurs when a patient who has been discharged from a hospital is admitted again within a specific time interval. Avoidable readmissions are a strong indicator of a fragmented health care system that too often leaves discharged patients confused, consumes resources that are already stretched thin, and produces higher treatment costs.

How can it help your organization?

Analytics solutions can be used to evaluate and predict which patients are at risk for readmission, so hospitals can create a plan to reduce that risk.

Benefits of implementing readmissions management

For providers:

Readmittance risk analysis. "Risk rate" patients before a hospital stay, as they go through treatment and recovery, and as part of the discharge process to assess their likelihood of being readmitted following discharge.

For payors:

Reduced hospital readmissions rate. Use analytics to help with reporting readmission rates and penalizing providers whose rates are high.

Reduced emergency department bounce-back rate. Reduce bounce back—an inpatient readmission that occurs when a patient seen in an emergency department returns after discharge because the condition doesn't improve after the treatment.

Readmissions management in action

[KenSci's risk prediction platform](#) assists health systems in determining population health risk, optimizing clinical results, and improving operational efficiency.

The platform helps answer these questions:

Who is likely to get sick?

How sick would they get?

How can care be optimized for outcomes and cost?

Sepsis accounts for considerably more hospital readmissions and related costs than any of the other medical conditions tracked by the government. KenSci's solution helps executives reduce the total cost impact of sepsis by identifying patterns and estimating patients who are at high risk. This enables care managers to prevent the responsible condition, readmission, and mortality.

Learn more by watching these videos:

[KenSci clinical analytics on Microsoft AppSource](#)

[Using machine learning and AI to reduce hospital readmissions](#)

Throughput management

Start with these questions

What is the average occupancy of your inpatient facilities?

How often are your facilities at capacity?

Do you ever have issues like long wait times in your emergency department caused by variance in demand for services?

Key benefits

For providers

Hospital bed optimization

Improved patient satisfaction scores (HACPHS)

Shorter wait times

Improved patient transfer process

What is throughput management?

The process known as *throughput management* includes systems and processes used to manage the cycling of patients through a health organization's physical facility.

Scenarios include moving an inpatient through the hospital or moving an urgent care or trauma case through the emergency department to either discharge or admission.

How can it help your organization?

With increasing patient demand and constrained physical resources, optimizing throughput is an essential operations management strategy. The use of data and analytics to optimize inpatient throughput enhances patient access, reduces unit cost, and improves service levels, leading to measurable value in metrics like reduced wait times, better use of capital, and an increased return on assets.

Improving throughput allows more patients to receive care at each facility, reducing the need to add expensive new facilities or beds.

Benefits of implementing throughput management

For providers:

Hospital bed optimization. Determine and predict the flow and progression of inpatients through a system, thereby maximizing use of patient rooms and facilities.

Improved patient satisfaction scores

(HACPHS). Correlate outcomes and experience data to patient journey paths. Identify reengineering opportunities by observing correlations and other data.

Shorter wait times. Predict and manage variables like staffing to improve efficiencies in care delivery in emergency departments.

Improved patient transfer process. Help staff spot and resolve bottlenecks in patient transfers within a facility (for example, a patient waiting to be admitted to intensive care, where a bed is available but not yet cleaned).

Throughput management in action

Inefficiencies leading to patient overcrowding in the emergency department can impede patient throughput. Nursing informatics and prediction can play an important role in improving emergency departments and staffing. Evergreen Health is using predictive analytics in its emergency department to align its staff with patient demand. Obtaining actionable data from patient in-flows helps Evergreen optimize staffing, reduce patient wait times, and ensure that patients receive the care they need when they need it.

KenSci has also developed predictive machine learning models that use data analytics. Actionable insights from KenSci's predictive analytics tools empower:

- Nursing leadership and staffing management to facilitate appropriate staffing and maintain nurse-patient ratios.
- Nurses to spend more time with patients and deliver high quality care.
- Administrators to improve the emergency department environment, and to reduce both burnout and turnover.

Learn more by watching this video on [how predictive analytics is helping nurses manage patient throughput](#).

06

Keeping up with the digital revolution

Because of bulk record keeping and strict regulatory requirements, healthcare is a data-intensive industry. AI and machine learning are helping healthcare providers and payors extract the real-time information necessary to make effective clinical and operational decisions. Improving the quality of care, identifying at-risk patients, engaging patients at all levels with personalized care, and reducing overhead costs are some of the areas in which AI and data have had the greatest impact.

The digital transformation revolution is deeply embedded in the improvement of nearly every aspect of the healthcare industry, and the trajectory extends forward, limited only by the time it takes to think up, develop, and implement new models.

To keep up with the latest uses of AI, visit [Microsoft Health](#).
